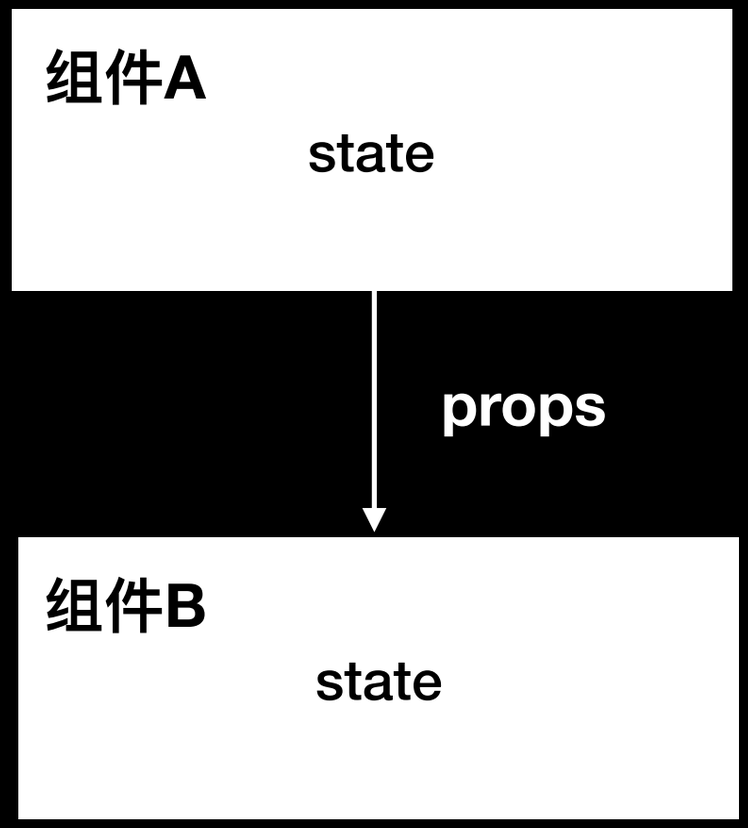
mirrors

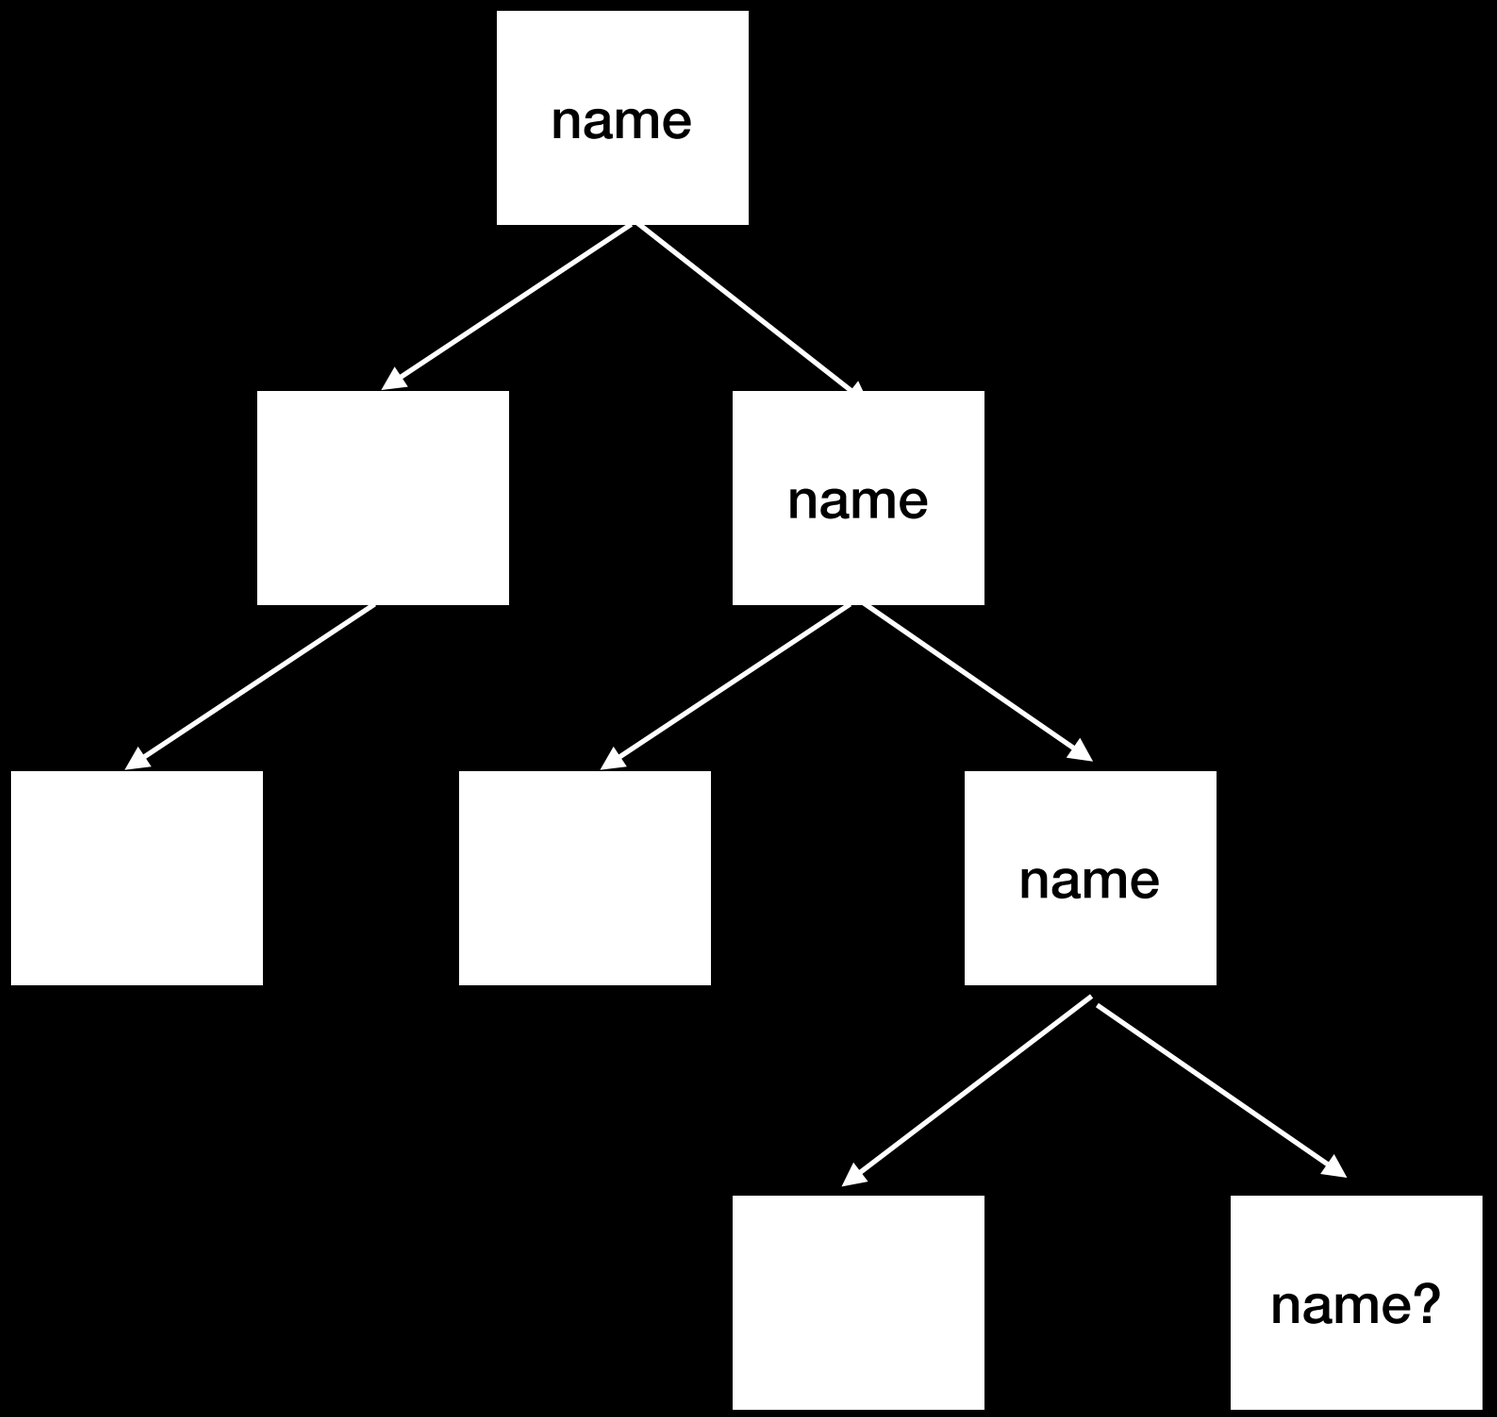
React是自上而下的单向组件数据流

每个组件通过

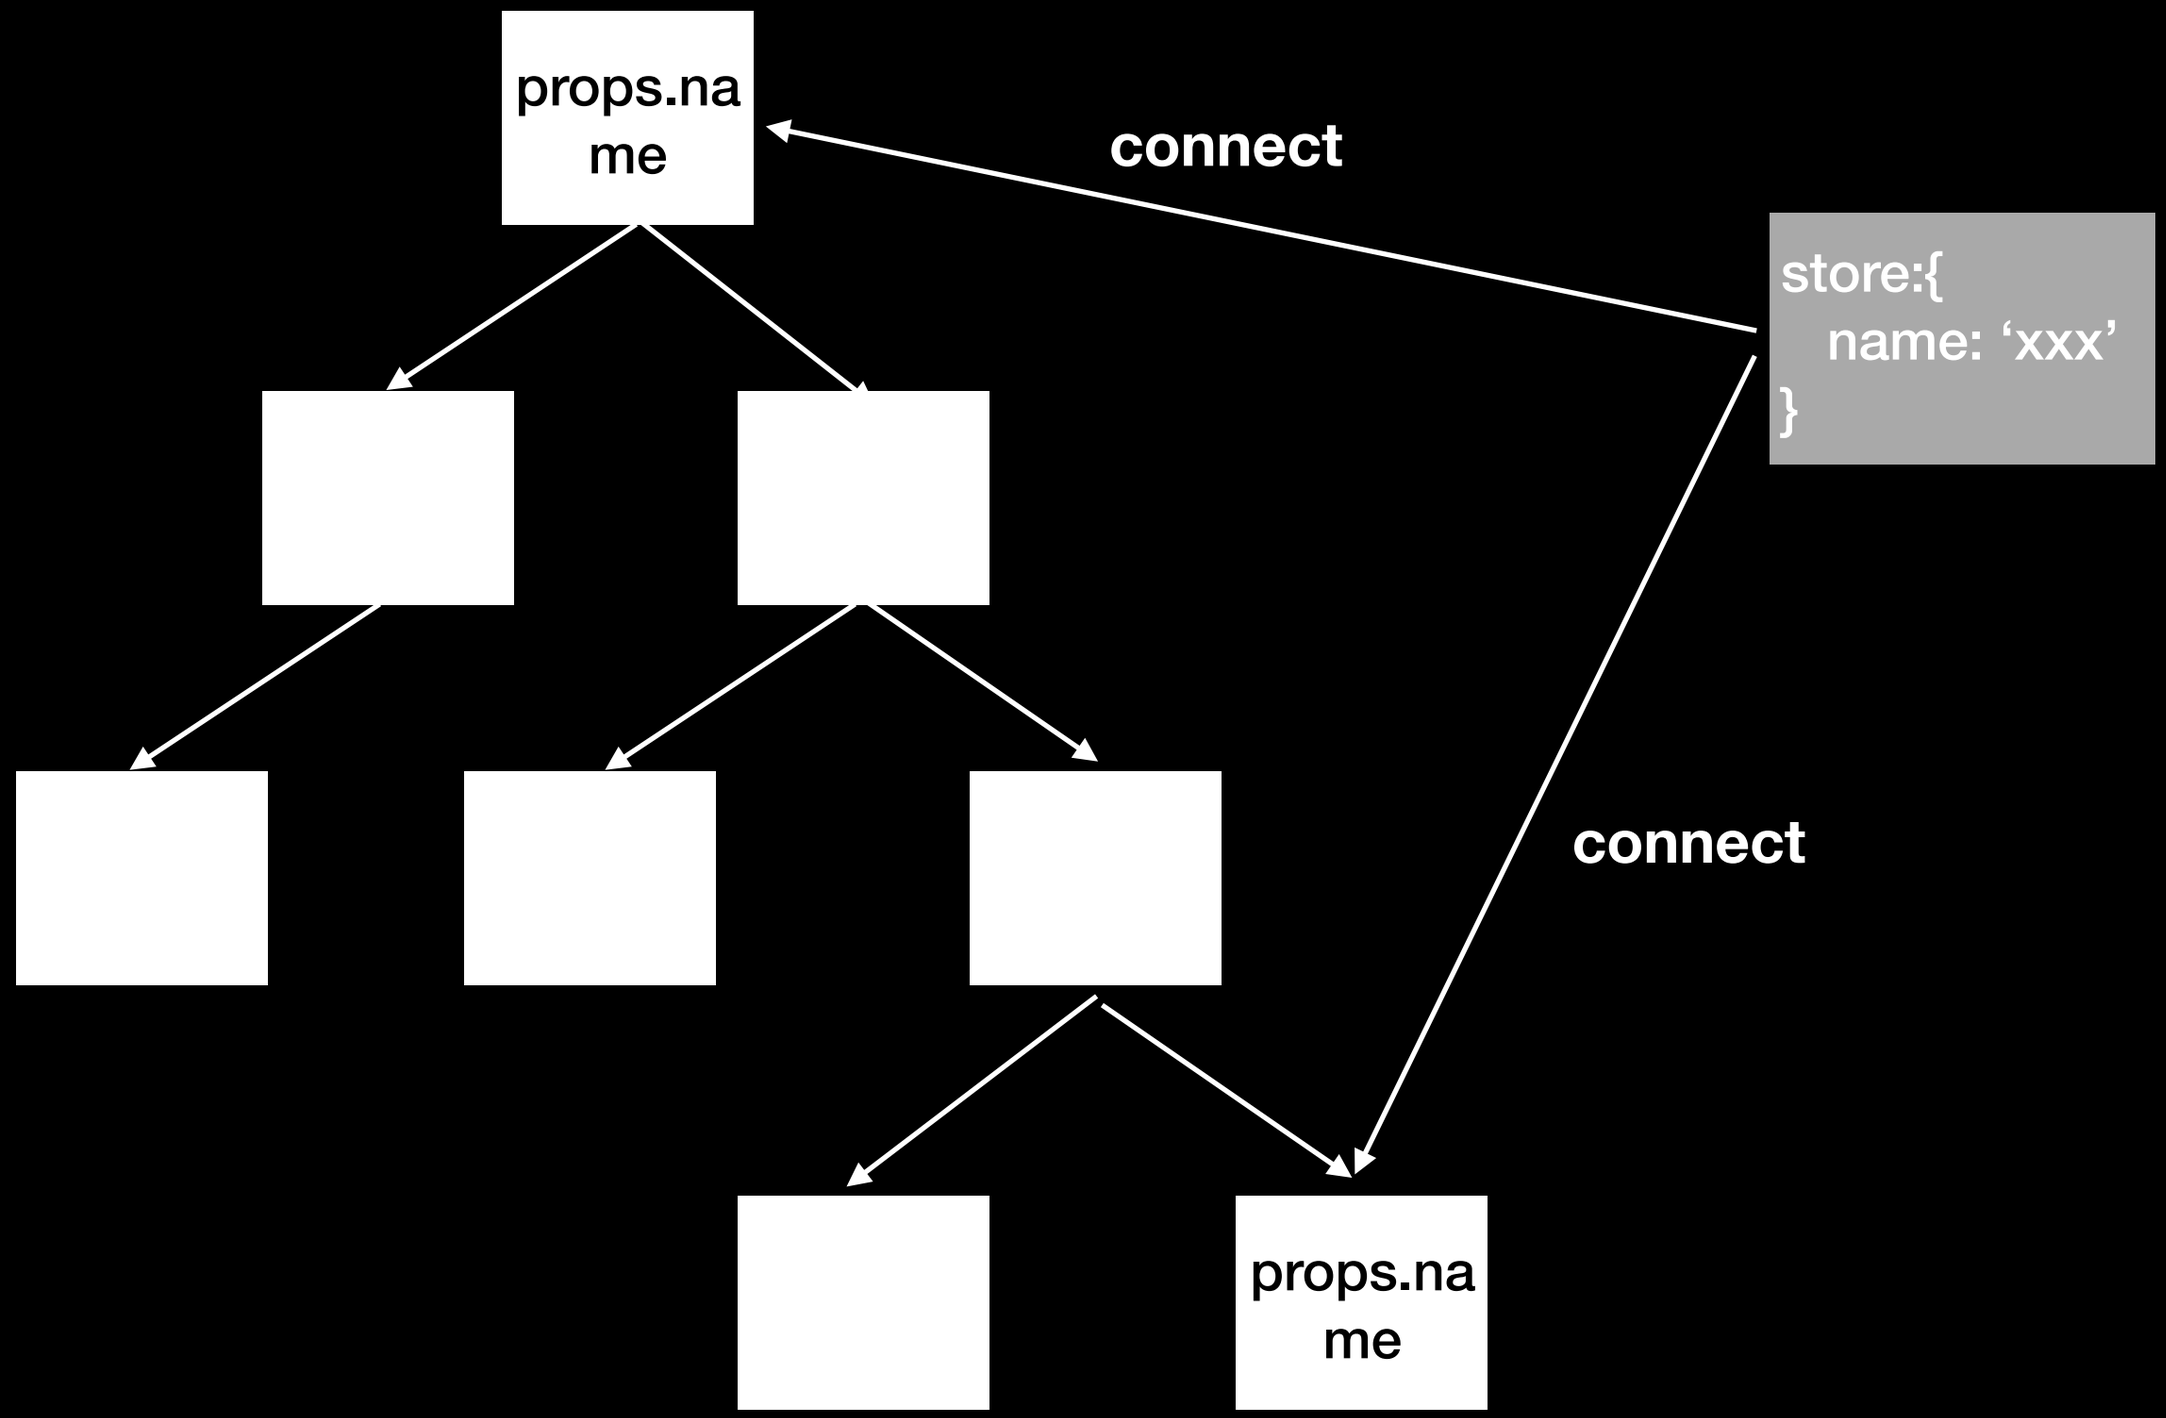
state+props来管理状态

两个组件之间数据传递





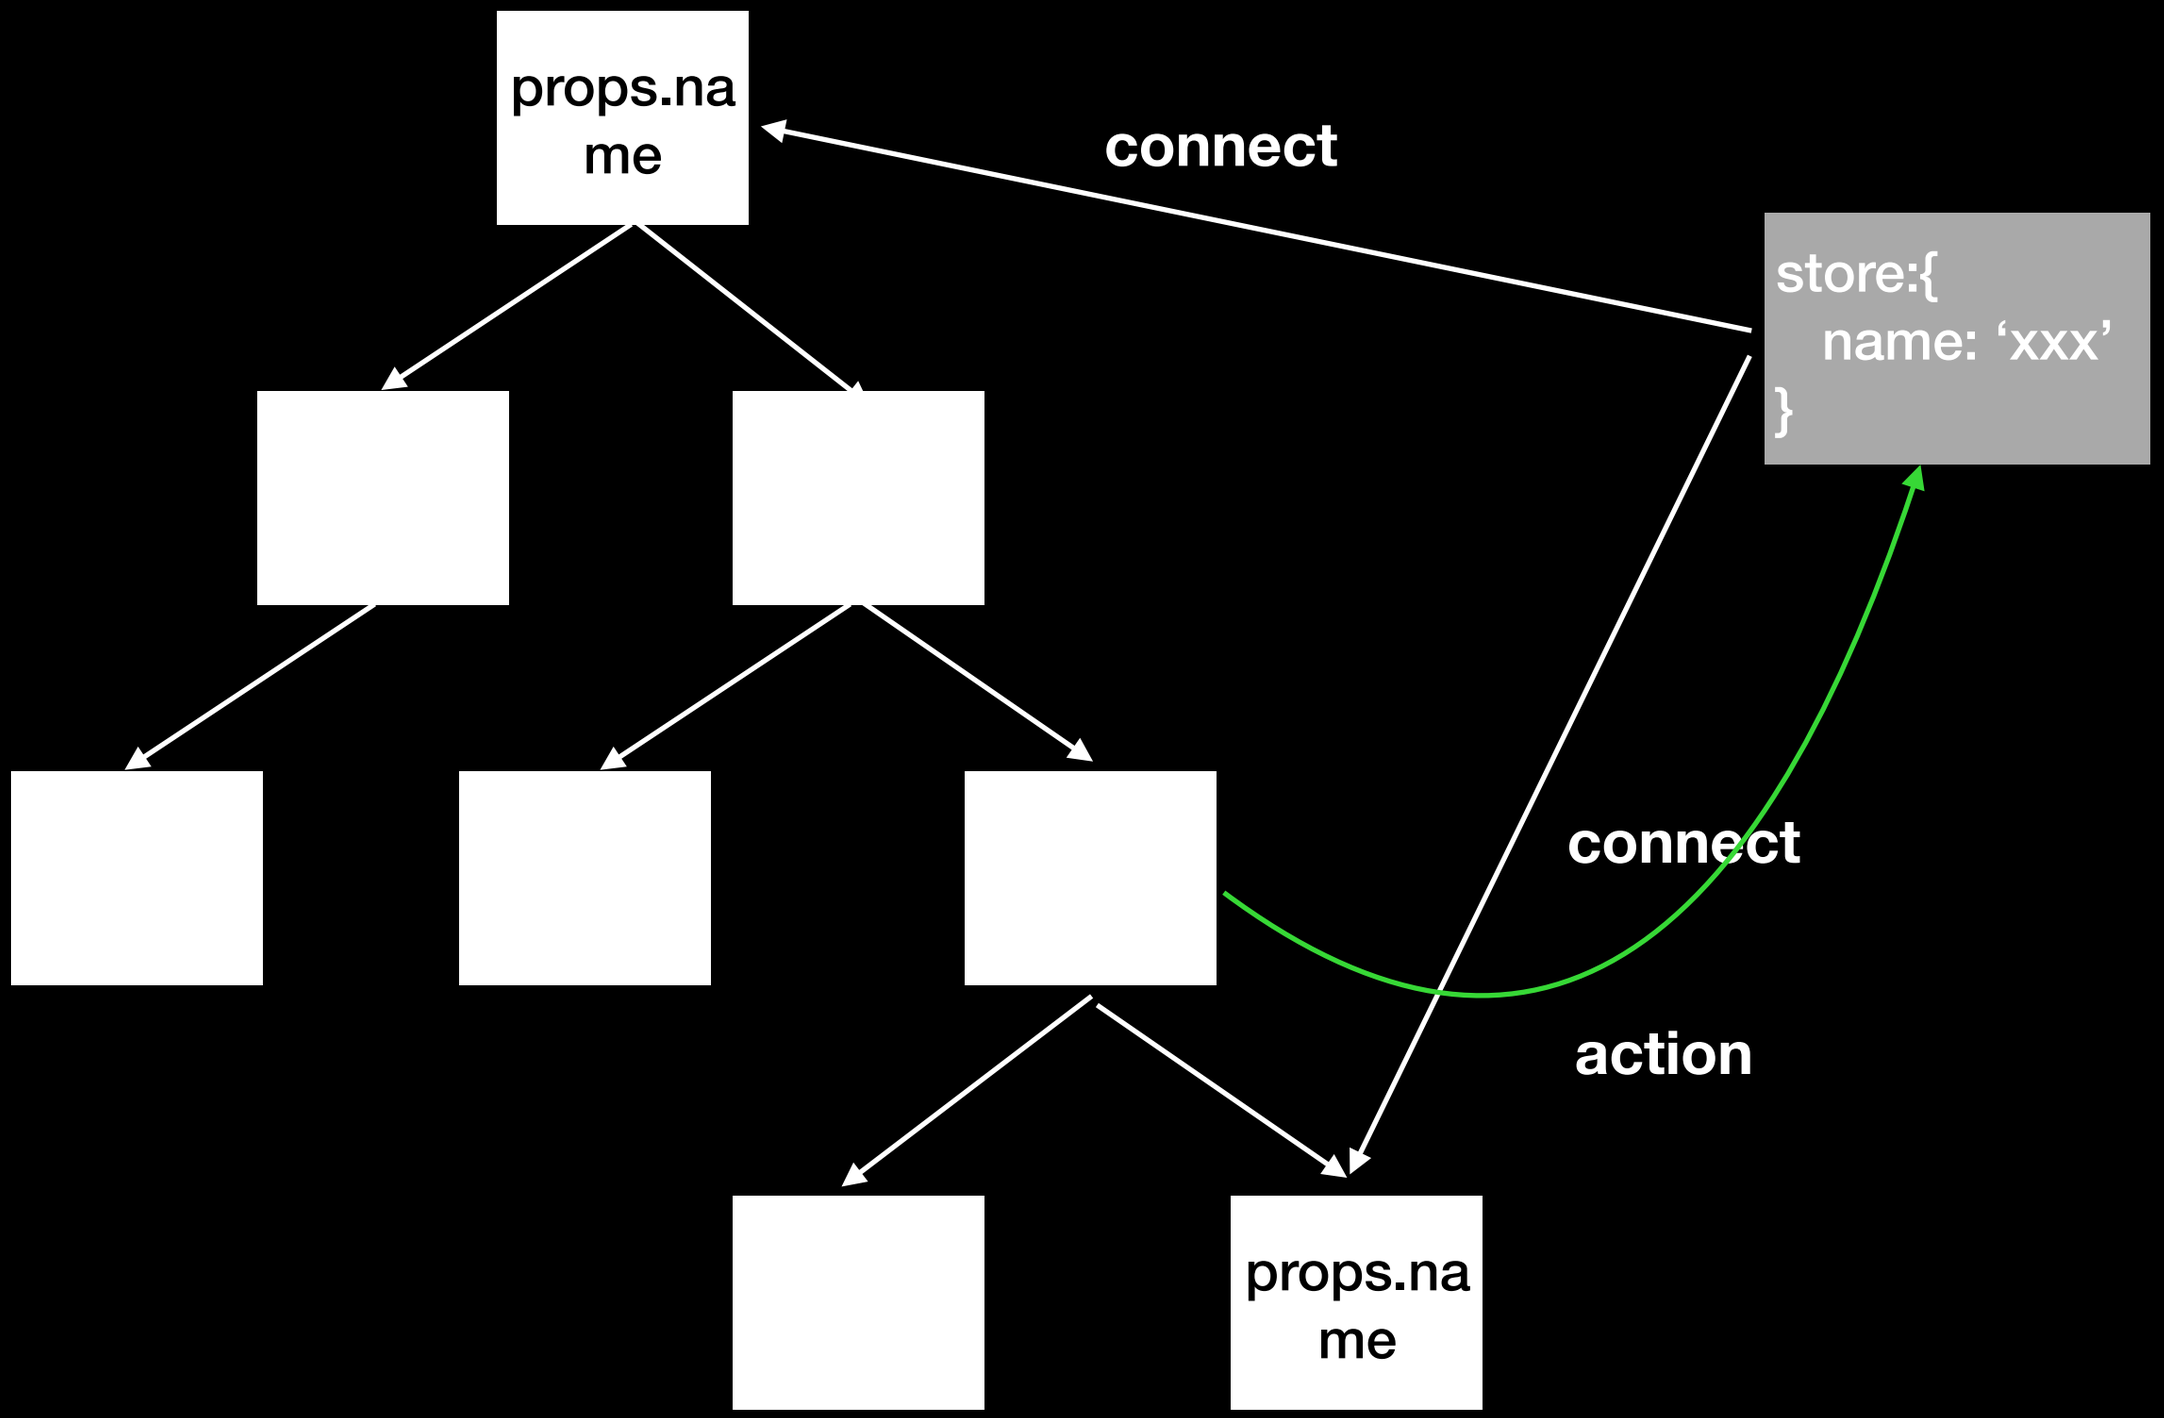
name
name
name
name?



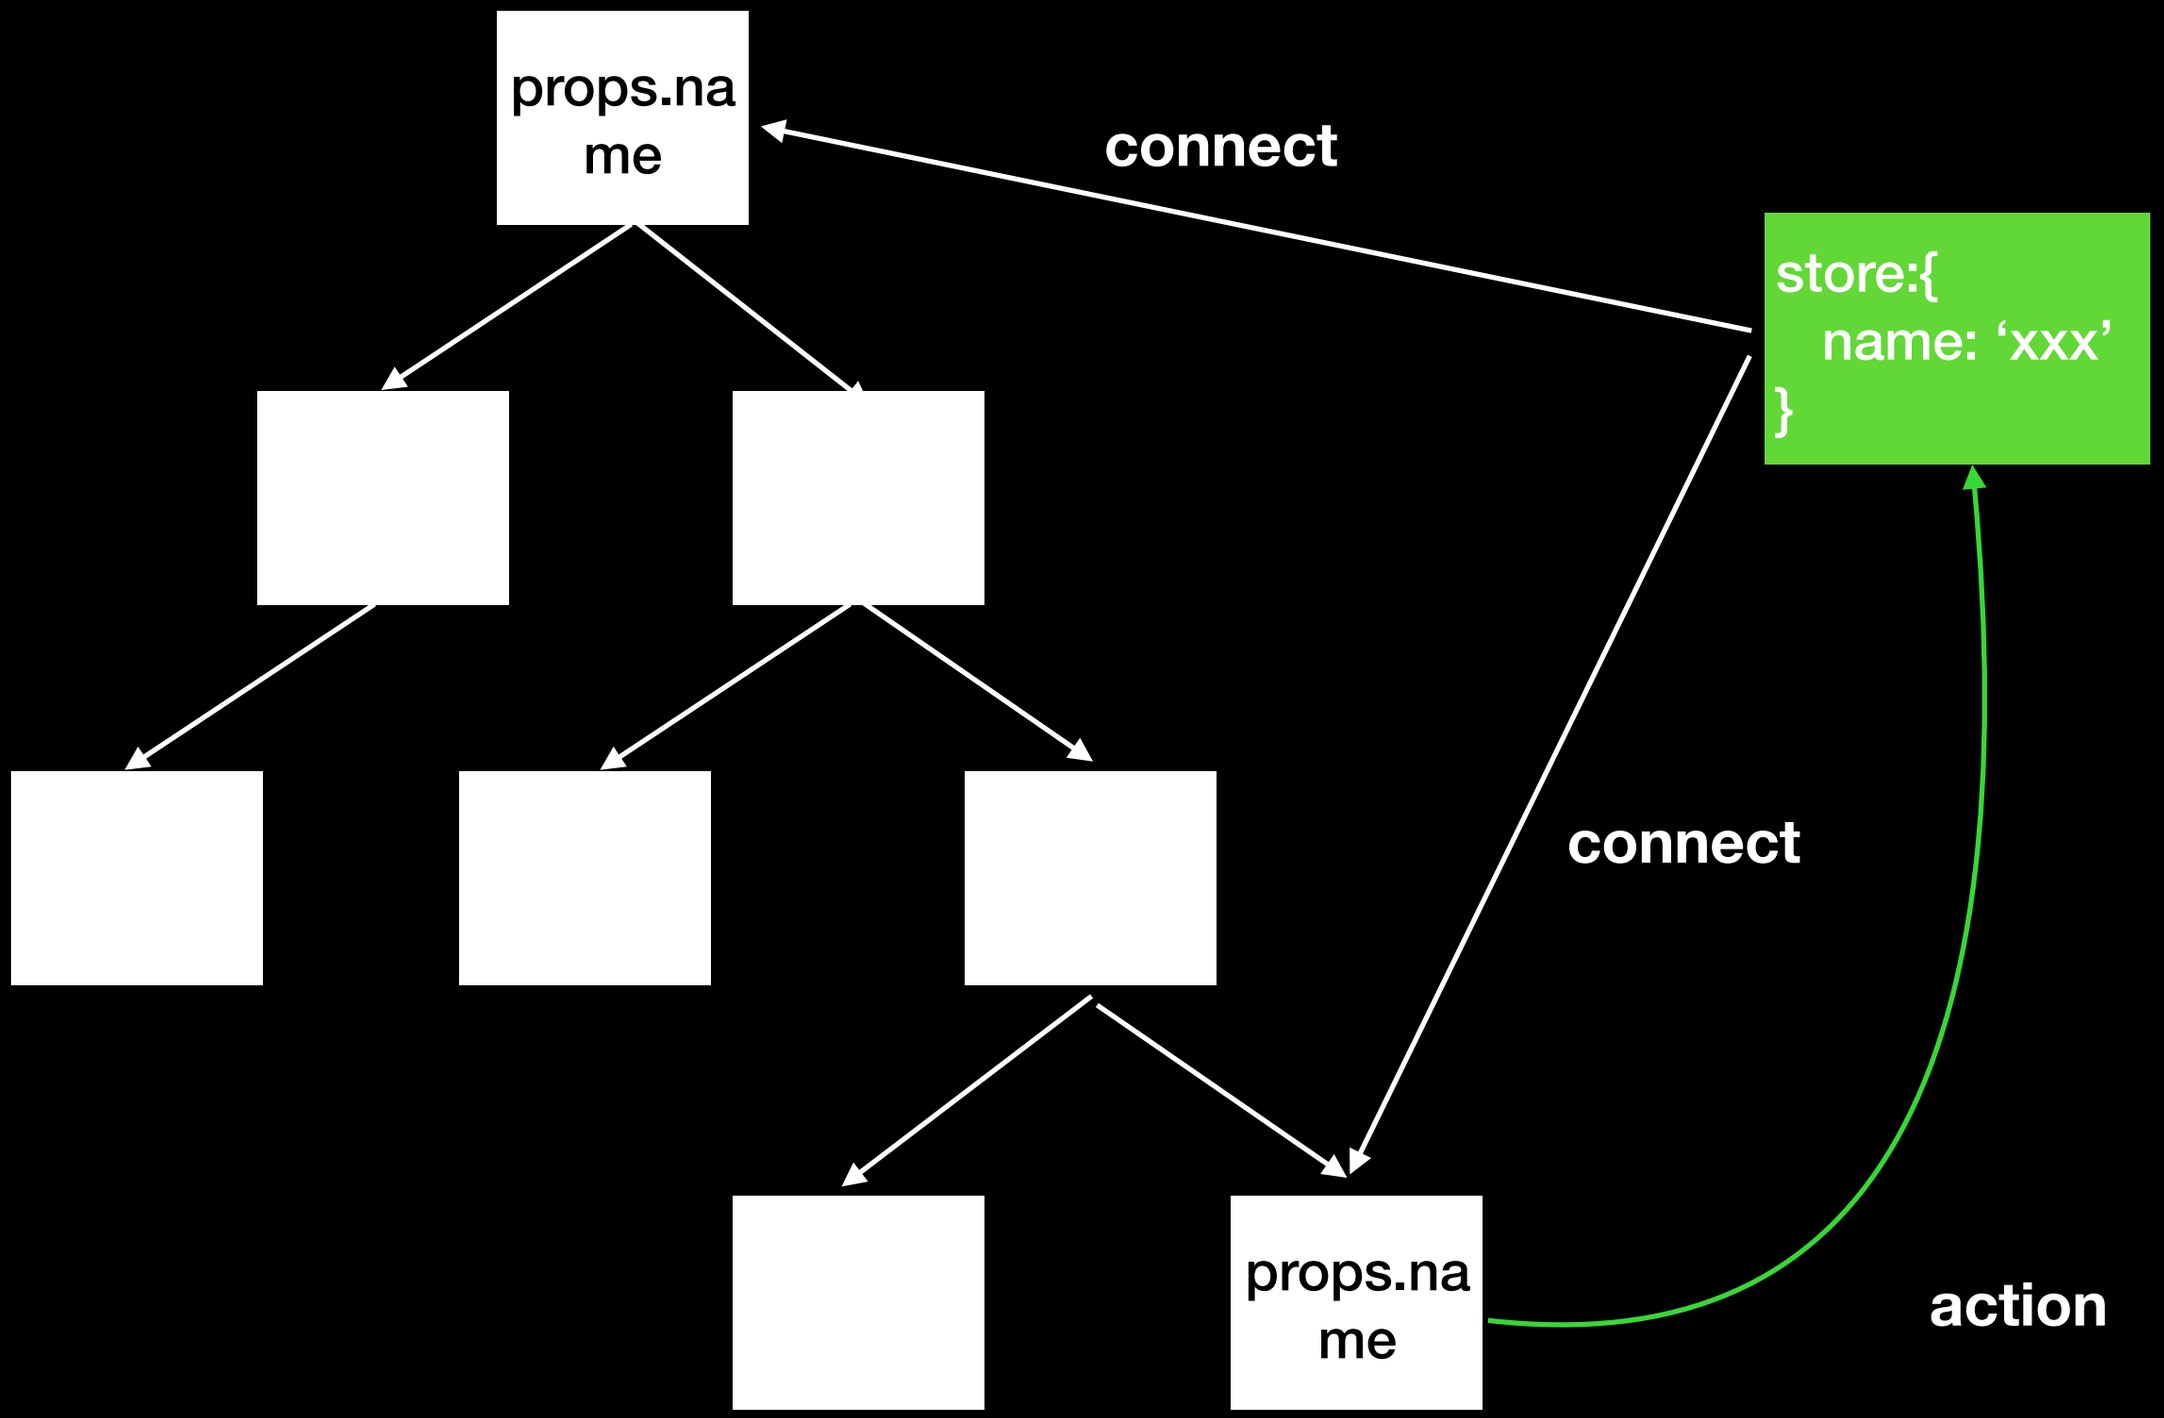
props.name
connect
store:{
name: ‘xxx’
}
connect
props.name

通过store.dispatch改

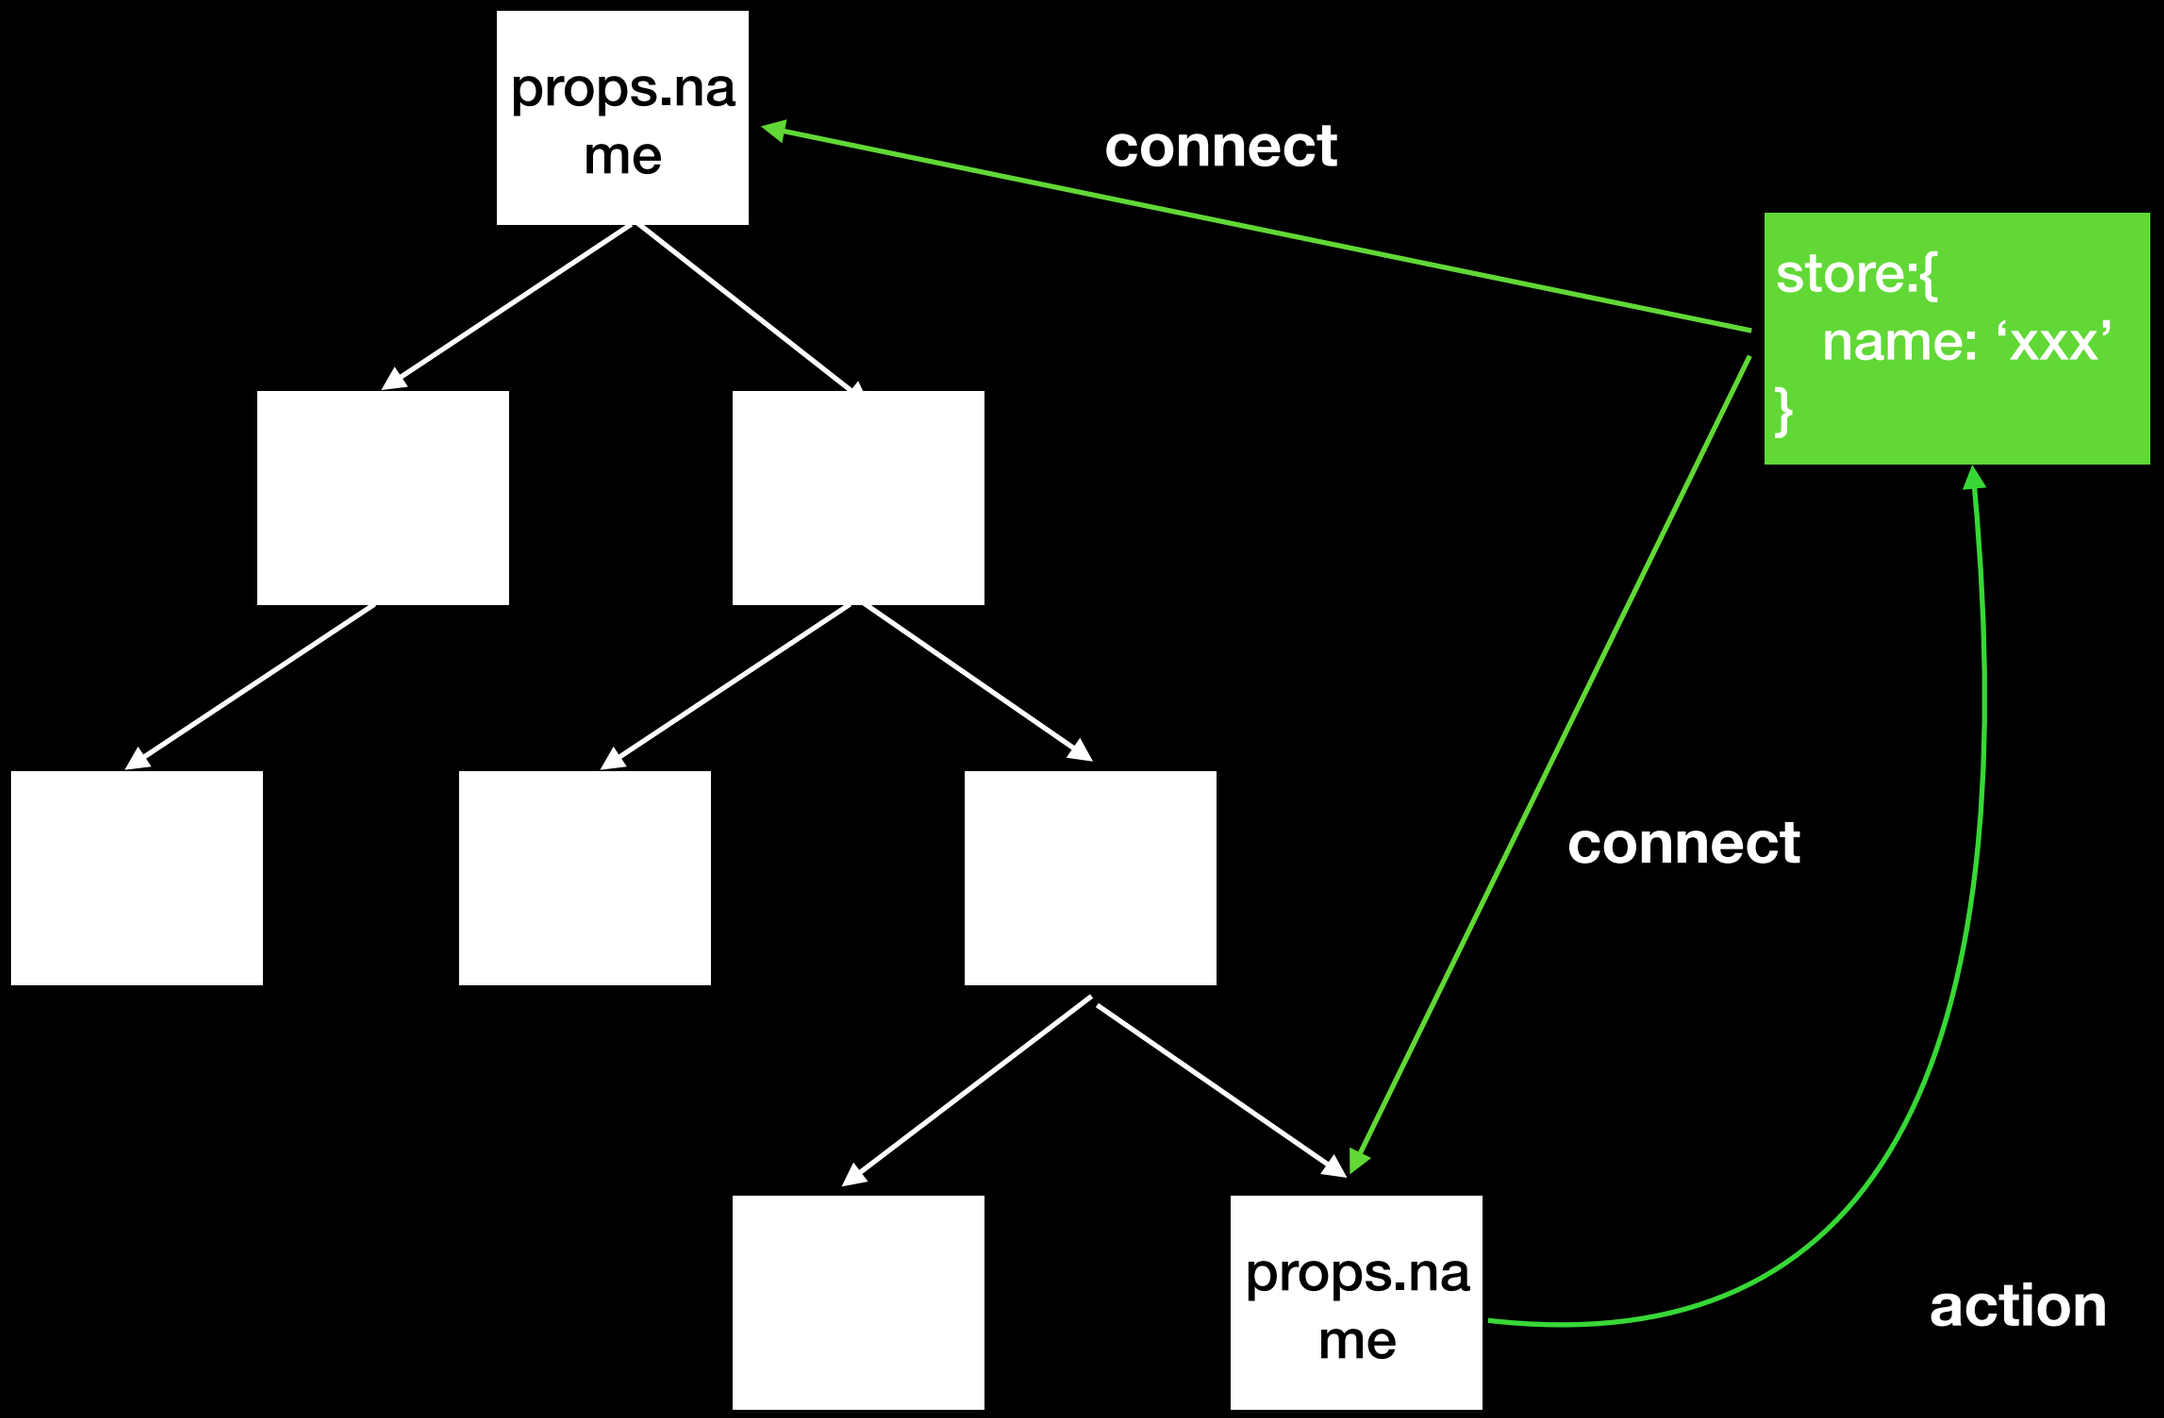
变store



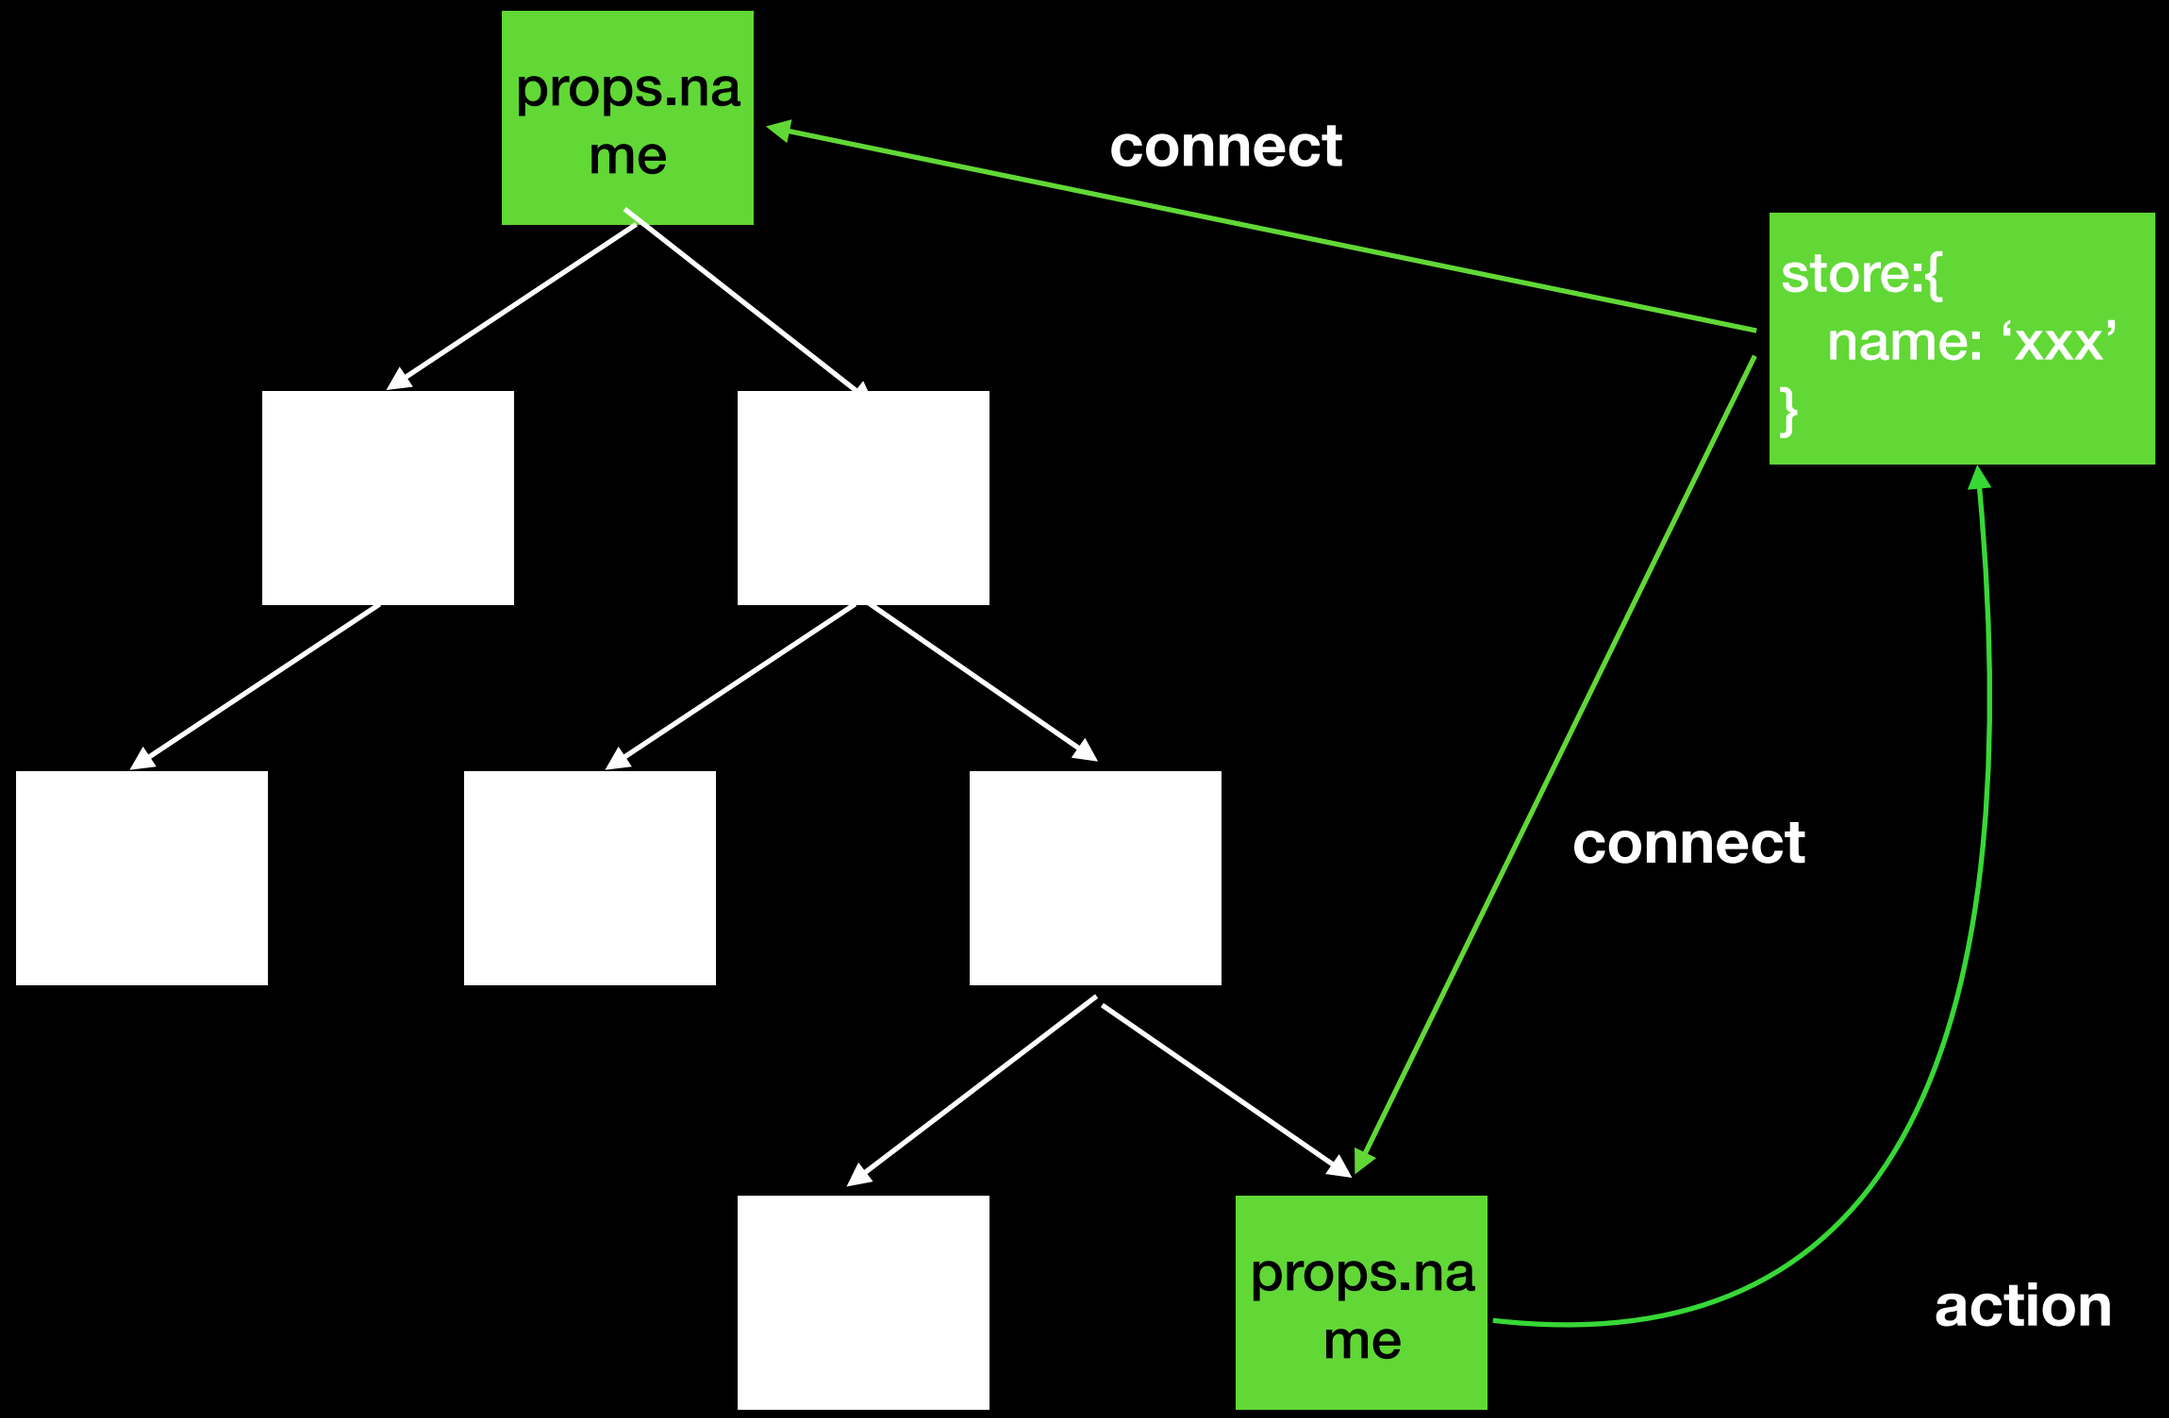
props.name
connect
store:{
name: ‘xxx’
}
connect
action
props.name



props.name
connect
store:{
name: ‘xxx’
}
connect
props.name
action



props.name
connect
store:{
name: ‘xxx’
}
connect
props.name
action



props.name
connect
store:{
name: ‘xxx’
}
connect
props.name
action

总结

store

action

reducer
